

Generative AI Assessment

Prompt Workflow

Scenario: Developing a Product Launch Strategy Using Generative AI

Objective

The aim of this workflow is to use Generative AI to develop a simple and practical product launch strategy. The process is divided into three connected stages. First, the product idea is analyzed, then a launch strategy is created based on the analysis, and finally the strategy is reviewed and improved.

Step 1 – Product Analysis and Planning

Prompt 1

Act as a product marketing expert. I am planning to launch a new product called SmartFit Bottle. It is a reusable smart water bottle that helps people maintain their daily water intake. Analyze this product and identify the target customers, the main problems it can solve, its important benefits, and its unique features. Based on this information, prepare a simple outline for launching the product. Write the answer in a clear and easy-to-understand way.

AI Output

The SmartFit Bottle can be useful for college students, working professionals, fitness enthusiasts, and people who are interested in maintaining a healthy lifestyle. Many people forget to drink enough water during their busy daily routine, and some people also find it difficult to keep track of how much water they drink. The product can help solve these problems by reminding users to drink water and helping them monitor their daily intake.

The main benefits of the SmartFit Bottle are that it encourages regular hydration, makes it easier to track water consumption, and helps users develop healthier daily habits. Its main selling points are smart hydration tracking, reminder notifications, and its reusable and convenient design.

For the product launch, the first step would be to identify the target customers and understand their needs. The product can then be promoted through social media by showing its features and benefits. A special introductory offer can be provided during the launch to attract customers, and customer feedback can be collected after the product is released.

Step 2 – Creating the Launch Strategy

Prompt 2

Using the product analysis and launch outline from Step 1, create a detailed but simple launch strategy for the SmartFit Bottle. Explain how the product should be positioned, who the main customers are, what marketing message should be used, how social media can be used, and what type of launch promotion can be offered. Also create a simple 30-day plan. Keep the strategy practical and suitable for a product with a limited marketing budget.

AI Output

The SmartFit Bottle should be positioned as a simple and useful product that helps people maintain better hydration habits in their everyday lives. The main target customers would be students, working professionals, fitness enthusiasts, and health-conscious people. The main marketing message could be

"Stay Hydrated. Stay Healthy. Stay Smart."

Social media can be used as the main marketing channel because it can reach a large audience at a relatively low cost. Short videos can be created to demonstrate how the bottle works, along with simple posts about the importance of drinking enough water. Customer reviews and user experiences can also be shared to build trust in the product.

During the launch, an introductory discount can be offered to encourage people to try the product. A referral offer could also be provided so that existing customers can recommend the bottle to their friends. The first week can focus on creating awareness, while the second week can focus on demonstrating the product and interacting with potential customers. The third week can focus on promotions and generating sales, and the fourth week can be used to collect feedback and evaluate the results.

Step 3 – Evaluation and Refinement

Prompt 3

Now act as a senior marketing manager and review the launch strategy from Step 2. Check whether the target audience is clear, whether the marketing message is attractive, whether the strategy is suitable for a limited budget, and whether the 30-day plan is realistic. Also check whether the main benefits of the product are clearly explained. First explain any weaknesses you find, and then provide an improved final version of the launch strategy.

AI Output – Critique

The strategy has a clear target audience and a simple marketing message. It is also suitable for a limited budget because it mainly depends on social media and low-cost promotional activities. However, the 30-day plan could be made more specific, and the strategy would be stronger if it included simple ways to measure the success of the campaign, such as social media engagement, customer enquiries, and sales.

Final Improved Strategy

The SmartFit Bottle will be introduced as a convenient reusable bottle that helps people maintain better hydration habits. The main customers will be college students, working professionals, fitness enthusiasts, and health-conscious people. The product will focus on solving the common problem of forgetting to drink enough water during a busy day.

The main marketing message will be "Stay Hydrated. Stay Healthy. Stay Smart." Social media platforms can be used to promote the product through short demonstration videos, hydration tips, customer reviews, and simple posts explaining the benefits of the bottle. This approach can help reach customers without requiring a large advertising budget.

A limited-time introductory discount can be provided when the product is launched. A referral offer can also encourage existing customers to recommend the product to their friends. During the first week, the focus will be on creating awareness about the product. The second week will focus on product demonstrations and customer interaction. The third week will focus on promotional offers and increasing sales, while the fourth week will focus on collecting customer feedback and reviewing the campaign results.

The success of the launch can be measured by looking at social media engagement, customer enquiries, product sales, customer feedback, and referrals. Based on these results, the marketing strategy can be improved for future campaigns.

Conclusion

This workflow shows how Generative AI can be used for a real-world business task through multiple connected steps. The first step analyzes the product, the second step uses that analysis to create a launch strategy, and the third step reviews and improves the strategy. Therefore, the workflow follows the required chained prompting method and includes a self-evaluation stage.
